& NBER

Federal Trade Commission Microeconomics Conference  
November 2, 2023

- Although platforms create significant benefits, they also expose users to potential harms:
  - Breaches of privacy and personal data
  - Misinformation, cyberbullying, hate speech
  - Fraudulent or unwanted advertising
  - Dangerous, defective, or counterfeit products
- Platforms have had notable success avoiding liability.
  - Section 230 & digital content created by participants
  - Retail platforms versus traditional sellers
- These issues are playing out in legislatures and courts.

# Example: Facebook

# Example: Epic Games

The screenshot shows the Epic Games website interface. At the top, there is a navigation bar with the Epic Games logo, links for STORE, SUPPORT, and UNREAL ENGINE, a globe icon, a user profile icon with the text SIGN IN, and a blue DOWNLOAD button. Below the navigation bar is a search bar with a magnifying glass icon and the text Discover with a dropdown arrow. The main content area features a large promotional banner for the Fortnite x Dragon Ball Z collaboration. The banner shows two characters, Son Gohan and Piccolo, in their Dragon Ball Z attire, flying over a city. The text on the banner reads: **FORTNITE** x **DRAGON BALL Z**, NOW AVAILABLE, Son Gohan and Piccolo power up the return of Fortnite x Dragon Ball. Below this text is a white button that says PLAY FOR FREE. To the right of the banner is a vertical list of game recommendations, each with a small game icon and the game title: Hogwarts Legacy - Delux..., February Savings, Fortnite (highlighted with a grey background), Dying Light 2 Stay Human, The Sims™ 4, and Deliver Us Mars.

to fraud that started on social media.

# Example: Amazon & Hoverboards

PLAY WITH US!

## Example: Amazon & Hoverboards

“Amazon is well situated to take cost-effective measures to minimize the social costs of accidents.”

# Overview of Model and Results

- Should platforms be held liable when participants are harmed?
- Two-sided platform with users on one side & firms on other.
  - Users get **utility** from being on the platform.
  - Firms get **benefits** from interacting with users
- Some firms are bad actors and may cause **harm** to users.
- If firms have **deep pockets** then just hold the **firms liable**.
  - Bad firms are **deterred**
- If firms **judgment proof** and under-deterred, then should hold the **platform liable**.
  - Incentive to **detect and remove** bad firms
  - Incentive to raise interaction price to **deter** bad firms
- Relevant factors include the type of platform, consumer information, market structure, litigation costs, etc.

- 1 Introduction
- 2 Brief Literature Review
  - Law and Economics
  - Platform Economics
- 3 Numerical Example
- 4 Baseline Model
- 5 Three Extensions
  - Heterogeneous Users
  - Retail Platforms
  - Platform Competition
- 6 Concluding Thoughts

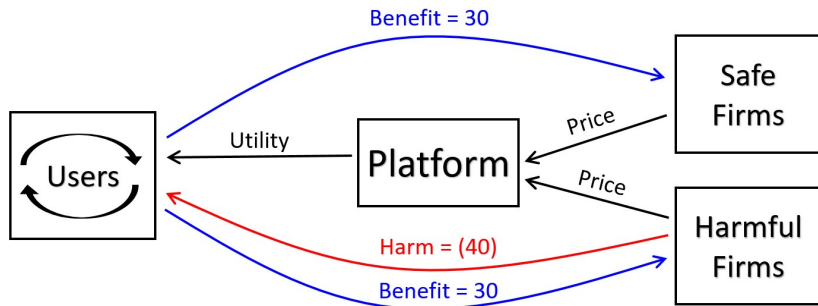

# Brief Literature Review

- The “**judgment proof**” problem.
  - If injurers are immune from (or can evade) liability then effort too low, activity level too high (Shavell, 1986)
- Rationale for **extending liability** to third parties.
  - Manufacturers (Hay & Spier, 2005)
  - Lenders (Pitchford, 1995)
  - Managed Care (Arlen and MacLeod, 2005)
- Economics of **multi-sided platforms**.
  - With cross-side externalities, **one side may pay nothing** (Rochet & Tirole, 2003, 2006; Armstrong, 2006)
  - Seller exclusion (Hagiu, 2009), control rights (Hagiu & Wright, 2015, 2018), governance (Teh, 2022)
  - Policy pieces (Buiten et al., 2020; Lefouili & Madio 2021)
  - Working papers on copyright (De Chiara et al., 2021; Jeon et al., 2022) and retail (Zenny, 2023; Yasui, 2022)

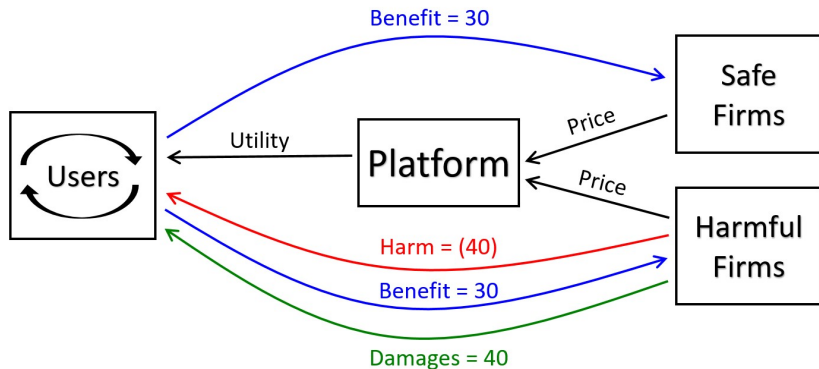

# Numerical Example

## Bystanders Users & Monopoly Platform

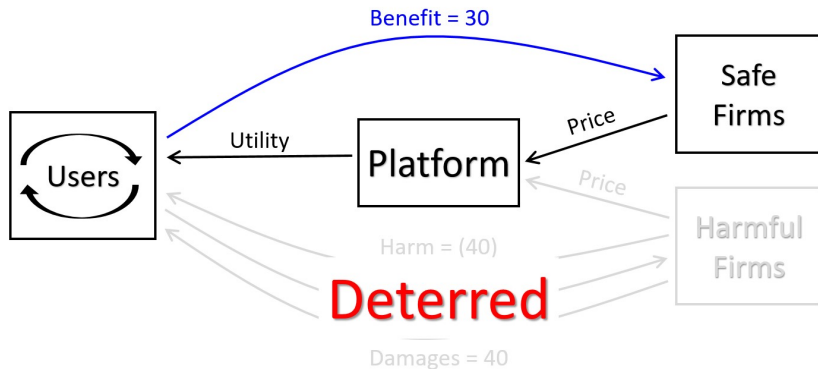

# Firms Have Deep Pockets

Firms 100% Liable

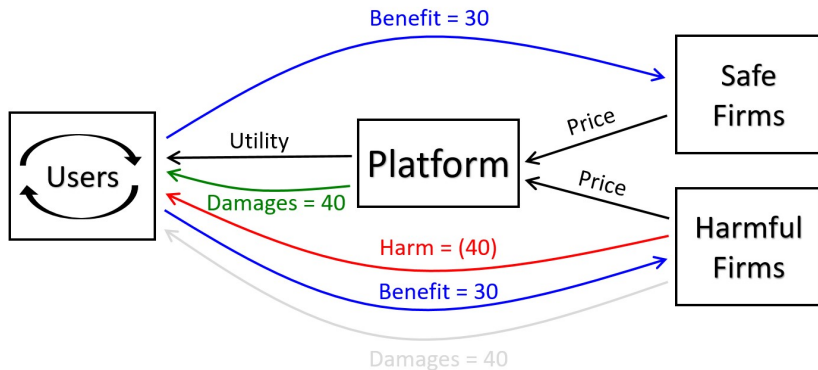

# Firms Have Deep Pockets

Firms 100% Liable

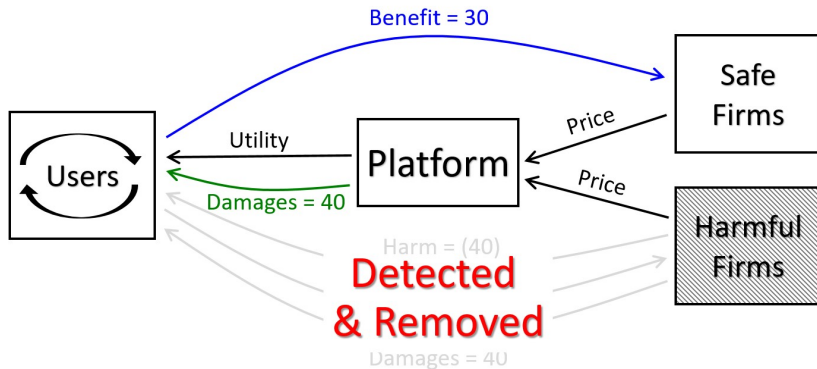

# Firms Totally Judgment Proof

Platform 100% Liable

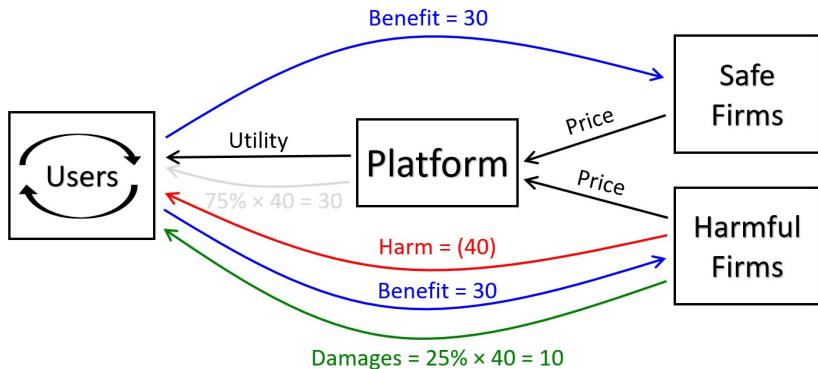

# Firms Totally Judgment Proof

Platform 100% Liable

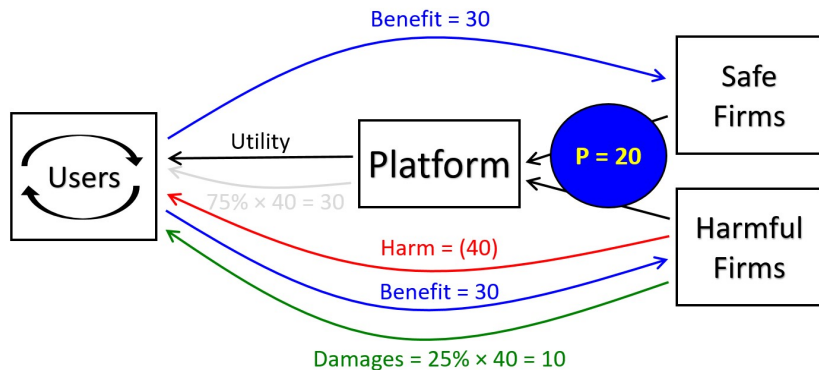

# Firms Moderately Judgment Proof

Firms 25% Liable, Platform 75% Liable

# Firms Moderately Judgment Proof

Firms 25% Liable, Platform 75% Liable

# Firms Moderately Judgment Proof

Firms 25% Liable, Platform 75% Liable

# The Baseline Model

- Users are **bystanders**. Consent not required for interactions.
- Some firms are harmful ( $H$ -types), some are safe ( $L$ -types).
  - $\lambda \in (0, 1)$  is fraction of  $H$ -types
  - $H$ -types enjoy higher interaction benefits:  $\alpha_H > \alpha_L$
  - $H$ -types cause harm  $d$  with higher frequency:  $\theta_H > \theta_L$
- $H$ -types are socially inefficient:

$$\alpha_H - \theta_H d < 0 < \alpha_L - \theta_L d$$

- Platform can prevent social harm in two ways:
  - Raising interaction price  $p$  to deter harmful firms
  - Investing to detect and remove harmful firms (auditing).  
Probability of detection  $e \in [0, 1)$  and  $c(e)$  is cost.
- If user suffers harm, responsible firm and platform pay damages  $w_s \geq 0$  and  $w_p \geq 0$  where  $w = w_s + w_p \leq d$ .

# The Baseline Model

## Equilibrium Analysis

- Type- $i$  firm seeks to join platform if

$$\alpha_i - \theta_i w_s - p \geq 0$$

- $H$ -type may have higher or lower rents. Rents equal if:

$$w_s = \hat{w} = \frac{\alpha_H - \alpha_L}{\theta_H - \theta_L} < d.$$

- If  $w_s < \hat{w}$  then **safe firms are marginal**.
  - If  $L$ -types join platform then  $H$ -types join
  - Auditing necessary to remove  $H$ -types
- If  $w_s > \hat{w}$  then **harmful firms are marginal**.
  - Platform may deter  $H$ -types by raising price  $p$
  - Auditing unnecessary

# The Baseline Model

Case 1:  $w_s < \hat{w}$

- Safe firms are marginal.
  - Platform sets  $p^* = \alpha_L - \theta_L w_s > 0$
  - $H$ -types capture information rents
- Social planner's auditing effort:

$$S'(e^{**}) = -\lambda(\alpha_H - \theta_H d) - c'(e^{**}) = 0$$

- Platform's auditing effort:

$$\Pi'(e^*) = S'(e^*) - \lambda\theta_H(d - w) + \lambda(\theta_H - \theta_L)(\hat{w} - w_s) = 0$$

- Private and social incentives for auditing diverge.
  - Auditing confers **positive externality** on user-bystanders
  - Auditing imposes **negative externality** on  $H$ -type firms

Optimal platform liability is less than full:

$$w_s + w_p^* < d$$

# The Baseline Model

Case 2:  $w_s > \hat{w}$

- Harmful firms are marginal.
  - Price  $p^* = \alpha_L - \theta_L w_s > \alpha_H - \theta_H w_s$  deters the  $H$ -types
  - Auditing is unnecessary!
- Will the platform charge  $p^*$  and deter the  $H$ -types?
- Not necessarily. Platform accommodates the  $H$ -types if:

$$\lambda(\alpha_H - \theta_H w) > (1 - \lambda)(\theta_H - \theta_L)(w_s - \hat{w})$$

- Net revenue from accommodating marginal  $H$ -types
- Information rents captured by inframarginal  $L$ -types
- Absent platform liability, the platform's private incentive to raise the price and deter the  $H$ -types is too low.

Full residual liability on platform aligns incentives:

$$w_s + w_p^* = d.$$

# 1. Heterogeneous Users

- Baseline model assumed homogeneous users.
  - Platform usage didn't vary with risk of harm
- Not everyone participates in social media, even though free.
  - Personal preference
  - People vary in perceived benefits and risks
- Platform liability **stimulates user participation**. Two reasons:
  - Users rationally anticipate that platform is safer
  - Future damage award acts as a “rebate”
- Optimal level of platform liability is **weakly higher** than baseline model.
  - Platform does not consider marginal social gain from increased user participation

## 2. Retail Platforms

- Users are sophisticated **consumers** and firms are **sellers**.
  - Transactions require consumer consent
  - Consumers pay retail price to firm
  - Firms pay transaction fee to platform
- Retail price reflects **consumer beliefs**. If safety  $\uparrow$  then
  - retail prices  $\uparrow$ , transaction fees  $\uparrow$ , platform profits  $\uparrow$
- If **harmful firms marginal** then platform liability **unnecessary**.
  - Platform raises transaction fee to deter harmful firms
  - Retail price and platform profits rise
- If **safe firms are marginal** then platform liability is positive but **lower** than in baseline model.
  - Uncompensated harm now relative to expectations
  - Platform liability and firm liability are now complements

### 3. Platform Competition

- **Two platforms** compete head-to-head for users.
  - Users distributed symmetrically on Hotelling line
  - Firms can join both platforms
  - Users care about “distance” and safety
- If **harmful firms marginal** then raising interaction price deters bad actors and attracts users.
  - Low differentiation: platform liability unnecessary.
  - High differentiation: platform liability necessary
- If **safe firms marginal** then platform liability is same as baseline model.
  - Platform liability is less than full
- Policies/laws that change the nature of platform competition should be complemented by changes in platform liability.

# Concluding Thoughts

- **Should platforms be held liable for harms suffered by users?**
  - Strong case to be made if injurers are judgment proof
- Broader applications for newspapers and offline retailers, but particularly salient for online platforms
  - More severe judgment proof problems
  - Capability to detect and remove harmful firms
- Future avenues:
  - Safety regulation: substitute or a complement?
  - Strict liability versus negligence
  - Competition between asymmetric platforms
  - Indemnification and side contracting
